(54) Apparatus and method for digital data transmission

(57) A method and apparatus for carrying out synchronous co-division multiple access (SCDMA) communication of multiple channels of digital data over a shared transmission media (1162). The system includes modems at remote units (1164) and a central unit (1160) to receive time division multiplexed digital data arranged into timeslots or channels and uses orthogonal codes to encode each channel of multiple data and spread the

energy of each channel data over a frame of data transmitted in a code domain. Frames are synchronized as between remote (1164) and central units (1160) using a ranging scheme which is also useful in any other system transmitting data by frames in a distributed system where synchronizing the frames as between all units regardless of differences in propagation delays is necessary. Each frame in the SCDMA modulation scheme includes a gap or guardband containing no other data.

ACK OF UNITY OF INV

The Search Division considers that the present European patent appsication does not comply with the requirements of unity of invention and relates to several inventions or groups of inventions, namely:

1. Claims: 1-40

Remote unit modem to transmit digital data upstream to a headend modem or method of transmitting digital data upstream to a headend modem

2. Claims: 41-55

Remote unit modem to transmit digital data upstream to a headend modem or process of bidirectional digital data communication carried out by remote unit modem to exchange digital data transmissions with a headend modem

ANNEX TO THE EUROPEAN SEARCH REPORT ON EUROPEAN PATENT APPLICATION NO.

.... *** **** EP: 01 30 4541

This annex lists the patent family members relating to the patent documents cited in the above-mentioned European search report. The members are as contained in the European Patent Office EDP tile on.

The European Patent Office is in no way Exhib for Salae particulars which are thereby given for the purpose of information.
